Navo: Product Vision & Feature Guide

From intent to action. Founders: Navya and Ajay. Draft v1, November 1, 2026.

1. The idea in one page

Navo turns the things you save into things you actually do, automatically.

Every saved reel is an intention: visit this cafe, apply to this internship, cook this recipe, try this design. The intention is real, but the save is where it ends. We forget, we run out of time, the deadline passes, and the reel sinks under fifty newer saves.

Navo's core concept is **intent to action**. We read what you save, work out why you saved it, find the details that matter (deadlines, links, steps, places), and bring it back at the right moment with a clear next step. You don't have to write notes, set reminders or sort folders. You can if you want to. Navo does it for you by default.

Tagline: Saved is not done.

What Navo is

- A follow-through app for saved content, starting with Instagram reels.
- An automatic assistant that understands a save and prepares the next action.
- A place where saves get finished, cleaned up or let go.

What Navo is not

- Not another folder app or bookmark library. Organizing is a means, not the product.
- Not a to-do app you have to feed by hand.
- Not a feed. Navo never tries to keep you scrolling.

2. The problem

1. **We save and never return.** Instagram's Saved tab is a pile. The first reel you saved is buried under everything after it.
2. **We forget why we saved it.** Weeks later, a saved reel is just a thumbnail with no context.
3. **Deadlines pass silently.** Internship, scholarship and event reels carry dates. By the time we open them, it's too late.

4. **Saves go stale.** Places close, links die, opportunities expire, and nothing tells us.
5. **There's too much to review.** A backlog of hundreds of saves is overwhelming, so we avoid it.
6. **We don't have time when we do remember.** A 30-minute video doesn't fit a 10-minute gap, so we skip it again.

Our own test supports the gap in existing tools. A founder saved a reel containing a deadline of November 2 into a competing app, and no reminder arrived the day before. The user had to schedule one by hand. This is one test and needs to be repeated properly (see Section 12), but it shows the difference between *reminding* and *understanding*.

3. Who it's for

Beachhead: students and early-career people. Their saves come with hard deadlines (internships, scholarships, hackathons, fellowships, events), a missed deadline has a real cost, and we are this user ourselves.

Next circles: people who save places and travel plans (the Tokyo example), recipes and hobby tutorials, and designers collecting inspiration.

4. How Navo works, end to end

1. **Save.** Tap Share on a reel and choose Navo, or paste a link into the app.
2. **Understand.** Navo reads the reel (caption, speech, on-screen text) and works out what it is: an opportunity, a recipe, a place, a tutorial, inspiration.
3. **Remember the intent.** Navo suggests why you saved it and asks you to confirm with one tap.
4. **Prepare the action.** Navo extracts the deadline, links and details, and builds a short plan.
5. **Follow up.** Navo reminds you at the right time with a single next step. You tick it off, snooze it or let it go.
6. **Learn.** What you complete teaches Navo what you care about, so suggestions get better.

5. Features in detail

5.1 Effortless capture

- Share from Instagram using the normal Share button. No access to your Instagram account or saved folder is needed.
- Paste a link manually into a folder of your choice.
- Optional: add a tag or choose a space yourself. Automatic is the default, manual is always allowed.
- Later: links from YouTube Shorts, TikTok, websites and screenshots, so everything about one goal lives in one place.

5.2 The understanding engine (reel parsing)

This is the heart of the product. For each save, Navo extracts structured information, not just a category.

Content type	What Navo pulls out
Opportunity (internship, scholarship, hackathon)	Company, role, eligibility, deadline, application link, documents needed
Recipe	Ingredients, quantities, steps, cooking time
Place (cafe, restaurant, attraction)	Name, area, map location, what to try, best time
Tutorial / learning	Topic, length, level, steps or resources mentioned
Product	Name, price if shown, where to buy
Design inspiration	Style, tools, fonts and resources mentioned
Event	Date, time, venue, registration link

Accuracy rules (these protect trust):

- Every extracted deadline shows where it came from (caption, spoken, on-screen text) and is marked *confirmed* or *needs checking*.
- If a date is unclear, Navo asks you to confirm instead of guessing.
- Where an application link exists, Navo checks that it opens.

- AI-extracted details are always labeled as such, and the original reel is one tap away.

5.3 Intent memory (the signature feature)

When you save something, Navo captures **why**, not only **what**.

- Navo infers a likely intent: *Apply, Visit, Cook, Learn, Get inspired, Buy, Someday.*
- You confirm or correct it in one tap. No typing is required.
- Optional: attach the save to a project or goal, such as *Summer internships* or *Tokyo trip*.
- When the item comes back, you see the reason first: *"You saved this to apply for a summer internship."*

Intent memory solves "I don't remember why I saved this," and it powers everything below. A reminder with a reason gets acted on. A generic reminder gets ignored.

5.4 Automatic follow-up (no scheduling needed)

You never have to set a reminder, though you can.

- **Deadline-aware:** if a deadline is found, Navo schedules its own nudges (for example a week before, three days before, the day before and the morning of), tuned to how much preparation the task needs.
- **Time-aware:** items with no deadline come back at a sensible moment. A cafe returns on the weekend. A recipe returns before dinner time.
- **Context-aware (later):** a saved place can come back when you're nearby.
- **Manual override:** you can schedule your own reminders or turn off automatic ones for any item.

The promise: *if a reel has a date, Navo will remember it, even when you don't.*

5.5 Action plans

For items that imply real work, Navo builds a short plan, 2–5 steps, from the extracted details.

Example: internship

1. Check eligibility (requirements listed from the reel)
2. Prepare documents (CV, cover letter, any listed extras)
3. Submit the application (direct link)
4. Track the result (date applied, follow-up date)

Example: pizza recipe

1. Check ingredients against what you have
2. Grocery checklist for what's missing
3. Preparation steps
4. Cook and tick off

Plans are suggestions. You can edit, skip steps, or ignore the plan. Navo keeps the original source attached to every step. Each notification surfaces only the **next unfinished step**, so you are never faced with a wall of tasks.

5.6 Time-fit suggestions: "Got 10 minutes?"

Navo knows how long each save takes (video length, reading time, task size) and suggests what fits the time you have.

- **5 minutes:** a short reel or a quick application step.
- **15 minutes:** a short article or a recipe prep.
- **30 minutes:** a tutorial or a longer video.
- **Urgent:** a deadline coming up in two days always comes first, whatever your free time.

A home screen card says things like: *"You have 10 minutes. Here are 3 things that fit, and one deadline in 2 days."* Long saves can be split into parts or resumed later.

5.7 Backlog intelligence

When you have hundreds of saves, Navo decides what deserves attention.

- Finds deadline-sensitive items and puts them first.
- Detects duplicates and near-duplicates.
- Groups saves by goal or project.
- Flags items untouched for months.
- Suggests what to act on, what to keep and what to let go.
- A short **weekly review**: *"38 items waiting: 4 urgent, 12 to learn from, 9 for current projects, 13 probably outdated."*

5.8 Cleanup space and content health

A dedicated space for tidying up, designed to feel quick and satisfying.

- **Expired:** internship reels whose deadlines have passed, ready to archive in one swipe.

- **Dead or changed links:** pages that no longer open.
- **Possibly outdated:** tutorials or listings that look old.
- **Still good:** items verified as current.
- Bulk actions such as archive all expired, and *swipe to keep, done or let go*.

We will only claim a status Navo can verify. A passed deadline and a broken link are easy to detect. "This cafe has closed" is harder and will come later, with reliable sources.

Nothing is ever deleted silently. Archived items can always be restored.

5.9 The learning loop

Every tick, snooze and ignore is a signal.

- Navo learns which kinds of saves you actually come back to (recipes, design, opportunities, travel).
- It adjusts what it suggests, how often, and at what time of day.
- It learns when you act. If you only act in the evening, it stops nudging you at noon.
- You can see and adjust what Navo has learned about you.

5.10 Opportunity tracker (student wedge)

A dedicated view for internships, scholarships, hackathons and events:

- Cards with company, role, deadline and link
- Status pipeline: *Saved, Preparing, Applied, Waiting, Result*
- Sort by deadline, with an urgent-only view
- Applied count and follow-up reminders

Later, many students saving the same reel means Navo processes it once and builds a shared, verified record of the opportunity, which makes accuracy better for everyone.

5.11 Social: friends, shared folders and weekend plans

- **Shared folders:** collect saves together for a trip or project, such as fifty Tokyo reels from friends.
- **Go together:** *"Ajay saved this cafe. Want to go this weekend?"*
- **Weekend plan:** every Friday, three or four things from your saves that fit your weekend.
- This is the growth loop. Saves become shared plans, which brings new users.

5.12 Search

- Search by meaning: *"cheap dinner near college"* or *"internship deadline this week."*
- Search inside the extracted details (what was said, shown and written in the reel), not just the title.
- Filters by intent, deadline, type and time needed.

5.13 Trust and control

AI automation is only useful if people can trust it.

- Navo never loses an item. Anything it can't understand lands in an *Unsorted* inbox.
- It shows why something was categorized and makes correction easy.
- Original source links are always kept.
- Export and backup are always available.
- Nothing is sent to anyone, and nothing is posted on your behalf.

6. Example journeys

Internship. You save a reel at night. Navo reads the deadline (November 2) and apply link, and asks "Apply?" with one tap. A week earlier it tells you the deadline and what to prepare. The day before: *"Applications close tomorrow. Your CV is the last step."* You tick it off and Navo asks for the outcome later.

Pizza recipe. You save it on Tuesday. On Saturday afternoon Navo asks: *"Cook the pizza tonight?"* You get the grocery checklist and steps. You finish, tick it off, and Navo learns you like cooking reels.

Local cafe. You save a reel about a cafe nearby. On Friday: *"A cafe you saved is 10 minutes from you. Free this weekend?"* You go or snooze.

Design inspiration. You save a layout you love. Navo files it into your inspiration board and shows one saved piece a day, with the fonts and tools mentioned in the reel.

Tokyo. You save fifty reels. Navo groups them as places, pins them on a map and builds a trip collection. Friends can add theirs.

7. Notification philosophy

Trust is the product. Too many alerts and people delete the app.

- Quiet by default: at most one or two nudges a day, and none without a reason.
- Urgent beats everything: deadlines can break through the limit, nothing else can.
- Every nudge states why: *"You saved this to apply."*
- Every nudge has quick replies: Done, Later, Not interested.
- Navo learns from the replies and stays quiet for things you've dismissed.

8. How it's built (summary)

- **App:** React Native with Expo, with a share extension for iOS and Android.
- **Backend:** Supabase (Postgres and auth) with pgvector for semantic search.
- **Pipeline:** link in, public caption and thumbnail fetched, audio transcribed when it adds value, a small fast LLM returns structured JSON (type, intent, deadline, links, steps), an embedding is stored for search.
- **Cost control:** process each unique reel once and cache it, run expensive steps like transcription only when needed, and use small models.
- **Reminders:** scheduled local notifications for deadlines first, location-based later.
- **Analytics:** PostHog.

Biggest technical risk: getting reel content reliably and within platform terms. We will keep only the link plus the details we derive, let users add a caption or screenshot as a fallback, and review Meta's terms before launch.

9. How Navo is different

Competitors we found include Sorti, Saven, Ordo, Vestron, Stashr, ReelRecall, Recall, mymind and Raindrop. Based on their public listings, many offer AI sorting, search, and some form of reminder. We don't claim these features are missing. We claim a different job.

	Typical competitor	Navo
Core job	Store, organize, find	**Get it done**
Reminders	You schedule them, or generic resurfacing	**Automatic, from the deadline in the reel**
What it extracts	Category, tags, sometimes places and products	**Deadlines, links, eligibility, steps, intent**

	Typical competitor	Navo
After the reminder	Nothing	**Action plan and next step**
Why you saved it	Optional note	**Intent memory, inferred and confirmed**
Old saves	Pile up	**Cleanup space and content health**
Limited time	Not addressed	**Time-fit suggestions**
Learning	Little	**Learns from what you complete**

Our first-hand evidence: a deadline reel saved in a competitor produced no reminder until we scheduled one ourselves. We'll turn this into a repeatable comparison (Section 12) before we claim it publicly.

What we don't claim: that we're the only ones with AI, reminders or search, or that competitors are poor. We claim that none of them treat *follow-through* as the product, and we'll prove it with how many saved items turn into finished actions.

10. What we will not do (yet)

- Autonomous agents that apply or buy for you
- Complex recommendation feeds
- Heavy calendar integrations
- Ads, or anything that mixes with real deadlines
- Every content type at once

11. Phases

MVP (first build, a few weeks)

- Share or paste a link
- Parse the reel into type, intent and deadline/link
- Intent confirmation in one tap
- Automatic deadline nudges
- Basic action plan (2–5 steps) with tick-off

- Semantic search
- Target: opportunities and learning resources only

V1

- Time-fit suggestions and the Opportunity tracker
- Backlog weekly review
- Cleanup space (expired and dead items)
- Recipes and places added
- Learning loop v1

V2

- Shared folders, friends and weekend plans
- Cross-platform saves (YouTube, TikTok, web, screenshots)
- Location-based nudges
- Shared opportunity database and employer partnerships

12. Validation plan

1. **Repeatable competitor test.** Save the same 5 internship reels into Sorti, Saven and Ordo. Record whether each extracts the deadline, sets an automatic reminder and sends it. Keep screenshots and dates. This turns our one test into evidence.
2. **Interviews:** 15–20 students who save opportunities. Ask them to open their real saved items and show what they saved, what happened next, and what stopped them.
3. **Concierge test (2 weeks):** 10 students send us their opportunity reels. We extract the details and send reminders by hand. We count what they act on.
4. **Prototype test:** 5–10 users for a week with the MVP.

If we're wrong: if reminders are ignored or people already have a good system, we change the segment or the feature, not the whole idea.

13. Success metrics

- **North star: saved items turned into completed actions per active user per week.**
- Save-to-action rate (percent of saves that lead to a finished step)
- Deadline catch rate (opportunities acted on before the deadline)
- Reminder response rate (Done or Later, versus ignored)

- Day 7 and Day 30 retention
- Extraction accuracy (percent of deadlines and links correct)

14. Risks and answers

Risk	Our answer
Competitors add the same features	Win on depth in one segment, accuracy and speed
Instagram changes how sharing works	Share-sheet capture plus other platforms
Wrong deadlines destroy trust	Show source, ask to confirm, verify links
Notification fatigue	Strict limits, reasons, learning
Looks like a to-do app	Everything is automatic from the save
Consumer subscriptions are small	Student Pro tier now, opportunity layer later (unvalidated)
We haven't built anything yet	MVP and interviews before applying

15. Positioning for Y Combinator

One-liner (45 characters): Turn saved reels into things you actually do.

Insight: People don't lack a place to store saves. They lack follow-through. The gap between *I want to do this* and *I did it* is where the value is.

What separates us: other apps organize and remind. Navo understands the reel, pulls out the deadline, the link and the steps by itself, and drives the save to a finished action, with no scheduling and no setup.

Why us: we are the target user, and we're building it ourselves.

16. Decisions to confirm

1. **Plan style:** I recommend generating a short full plan, but showing only the next step in notifications.
2. **First segment:** I recommend opportunities and learning resources, with recipes and places in V1.

3. **Task managers:** I recommend staying standalone at first, with export to calendar and task apps later.
4. **App name spelling:** Navo or Nhavy.
